Dear Josh;

It is my turn again to ask you for something.
Can you send me a culture of adenineless neurospora, strain
3254 I think? I shall very soon have a supply of N¹⁵ labelled
adenine, and I should like to trace it in the nucleic acid
of the adenineless mutant. I'll try it also on the Coli
mutant. Are there any other purineless or pyrimidineless
mutants or any that requires nucleotides or nucleosides?
We are busy as hell, but things are coming along. How is it
with you? How's your wife?

Regards from Ada.

Sam
